Abstract

Cholesteryl glucoside (β-CG), a monoglucosylated derivative of cholesterol, is involved in the regulation of heat shock responses. β-CG, which is rapidly induced in response to heat shock, activates heat shock transcription factor 1 (HSF1) leading to the expression of heat shock protein 70 (HSP70) in human fibroblasts. Identification and biochemical characterization of the enzyme responsible for β-CG formation is important for complete understanding of the molecular mechanisms leading to HSP70-induction following heat shock. Recently, we demonstrated that β-CG synthesis was not dependent on UDP-Glucose but glucosylceramide (GlcCer) in animal tissue and human fibroblasts. Thus, we examined the possibility of glucocerebrosidase, a GlcCer-degrading glycosidase, acting as β-CG-synthesizing enzyme. Interestingly, the overexpression of β-glucosidase 1 (GBA1, lysosomal acid β-glucocerebrosidase) led to an increase in cholesterol glucosylation activity in human fibroblasts.

In the present study, we examined whether GBA1 acting as β-CG-synthesizing enzyme or not. Using a cell line generated from Gaucher disease patients with severe defects in GBA1 activity, we found that cholesterol glucosylation activity was very low in the cells. In addition, Cerezyme, a recombinant human GBA1 used in enzyme replacement therapy in Gaucher disease, exhibited Conduritol B-epoxide-sensitive cholesterol glucosylation activity. The optimum pH and temperature for cholesterol glucosylation by GBA1 were at about 5.3 and 43°C, respectively. Short chain C8:0-GlcCer was the most effective donor for cholesterol glucosylation activity among GlcCer containing saturated fatty acid (C8:0 to C18:0) tested. GlcCer containing mono-unsaturated fatty acid was more preferred substrate for cholesterol glucosylation when compared with GlcCer containing same chain length of saturated fatty acid. These results demonstrate, for the first time, a novel function of GBA1 as a β-CG-synthesizing enzyme. Therefore, our results also reveal a new pathway for glycolipid metabolism in mammals.
